

## The MS-990 Air Vibro Pencil

The **Air Vibro Etch Pencils** can be used for simple marking applications in pretty much any industry, however they have proven to be particularly popular in the Aerospace and Nuclear Industries and in most cases the feedback within these industries suggests that other pens are just not robust enough to stand up to the continuous use and the metals and alloys they are asked to perform on.

This is why after many years of experience Millennium Signatures continues to provide our **MS-990 Model**. We have offered this product since 1988 and the customer feedback on this product consistently supports that this specific model of Marking Pen is preferred over all others. Time and time again this Marking Pen is said to be the best built product our customers have seen. Its slim design makes it easy to write with, it has a quick easy to use on/off pneumatic control switch and an exhaust system that maintains quiet operation. Perhaps most importantly, the MS-990 is standardly equipped with a very robust marking tip and is ideal even for those applications that continuously require deep marking. The marking tip is designed so that it can be reground to sharpen if necessary.

The model MS-990 is supported with what we call a **Small Parts Kit**. This kit contains a replacement marking tip along with a heavy duty spring and three different "O" Ring seals. It is not often that these pens require a full service, but a small parts kit is cost effective way to quickly have an older more heavily used pen working like NEW again in a matter of minutes. Most other pens on the market leave you little choice but to replace the complete unit.

We have had exceptional success with the MS-990 consistently for an extended period of time. Given this products long history and exceptionally reliable service we consider this specific model to be a **Millennium Signature Series Product**.
